Count my words per minute typing

CPMΣ% The following are some of the typing equations and formulas that are used in calculating your typing statistics when you take our free typing test. Gross WPM Gross, or Raw WPM (Words Per Minute) is a calculation of exactly how fast you type with no error penalties. The gross typing speed is calculated by taking all words typed and dividing by the time it took to type the words in minutes. When calculating typing speed, a "word" is any five characters. For instance, "I love keyboarding, don't you?" would be counted as 6 words (30 characters / 5) and not just 5. This makes sense because typing "deinstitutionalization" obviously should count more than typing "my". Spaces, numbers, letters, and punctuation are all included, but any function keys such as Shift or Backspace are not included. This makes the number of words easy to calculate. Simply count all typed entries and divide by five to get the number of words typed. To give an example, if you typed 200 characters in 1 minute, your net wpm typing speed would be (200 characters / 5) / 1 min = 40 WPM. If you typed 200 characters in 30 seconds your net speed would be (200/5) / 0.5 = 80 WPM. A Net WPM calculation is preferred for measuring typing speed as opposed to the Gross WPM computation since including mistakes will give a more complete picture of your true typing abilities. However, Gross WPM is used in the calculation of the Net WPM calculation which merits its mention. Net WPM Net WPM is argueably the most useful tool in gauging typing abilities. Since errors play a part in its calculation, it is more a measure of typing productivity than of just typing speed. In other words, a fast but error-prone typist will receive a lower net typing speed than a slower but more accurate typist - relatively speaking of course. This makes sense because proof-reading and correcting errors takes up more time than simply typing a passage correctly in the first place. Less mistakes also means less chance for errors being missed during proof-reading and making their way into the final product. To calculate Net WPM, take your gross WPM result and subtract the amount of errors you left in per minute, also known as the error rate. To calculate error rate, simply divide the number of errors by the time you typed for in minutes. For example, if you typed for two minutes with a gross typing speed of 80 WPM and left in 8 mistakes, your error rate would be (8 errors / 2 mins) = 4 errors per minute. Your net typing speed would then be (80 - 4) = 76 WPM. Note that for every mistake you make per minute your typing speed goes down by 1 WPM. This is a rather simple equation - the hard part is actually deciding which types of errors should be counted. There are two kinds of errors: Errors that are made and corrected Errors that are made and not corrected The first impulse is to count all errors regardless of correction, however there are two strong arguments as to why only the uncorrected errors should be penalized: 1) Fixing mistakes not only messes up the typist's rhythm and likely causes brief pauses, but function keys like the delete key take time to press and do not count as a keyed entry. This means that the time penalty is already built into the process of correcting a mistake. An additional time penalty on top of the inherent time penalty discourages the typist from correcting their mistakes in the first place. While typists should be encouraged to avoid mistakes at all costs, they should also be encouraged and not discouraged from fixing mistakes as they are typing. Errors left in uncorrected are much more devastating and undesirable than errors fixed immediately while typing. 2) Take the case of a large number of corrected errors. Assume a one minute test was taken with a typing speed of 20 WPM. 20 errors were made during the test but all of them were immediately corrected. If we then deduct the error penalty considering all errors, we calculate the net speed as 0 WPM! An error-free length of text was obviously typed (20 * 5 - 20 = 80 characters to be exact), yet a typing speed of 0 WPM suggests nothing was ever typed. If the mistakes were left uncorrected, obviously one-fifth of a passage typed incorrectly would be a blunder to proofread and 0 WPM would be acceptable since the resulting text would be useless. The typist is still encouraged to reduce errors because obviously they would have typed faster than 20 WPM if they hadn't wasted time correcting 20 errors! These two points more than prove that only errors left uncorrected should be penalized. Accuracy Typing accuracy is defined as the percentage of correct entries out of the total entries typed. To calculate this mathematically, take the number of correct characters typed divided by the total number, multiplied by 100%. So if you typed 90 out of 100 characters correctly you typed with 90% accuracy. It is interesting to note that all errors, whether corrected or not, should be counted in the accuracy calculation, unlike the net WPM calculation. This is because the calculation is more "live" than typing speed and literally describes the likelihood that the next character will be typed correctly, regardless of whether it will be corrected or not. Watch on YouTube Word Counter Tool is the simple online utility to count number of words or number of characters online. You can either type in to Word Counter Tool or copy and paste content in to the application to count words and characters. You can 'SAVE' the paragraph and then continue another with processing another content or paragraph. The saved content will be available until you clear the same using 'Clear Saved' option. What are the applications of Word Counter Tool? You will find many situations where you need to calculate the number of words, characters and change case in a given paragraph. WordCounterTool.com comes handy in these situations where you can easily count words and characters on the fly online. You don't require additional software like MS Word and this service is provided free. You can also Save these words, paragraphs and content locally in your browser till you clear the same. Word Counter Tool is the only word and character counter utility that displays the count in real time. What are some uses of word counter and character counter? Word Counter Tool is the perfect companion for your English essay assignments in School. If you need to write a 400-450 word essay and have to stick to the limits, use Word Counter Tool to type your essay. With modern browsers, you even have spell checking enabled. If you are a professional blogger or content writer, then you can use Word Counter Tool to type your content. Most of these services require a word limit and you can use our tool for free and get paid for the great content you produce. If you are a web master or a SEO specialist, then you can Word Counter Tool to find the number of words in your Title tags and Description for Search Engine Optimization (SEO) efforts. Word Counter Tool is probably the only online application to change case of a paragraph and words online. With a mere click of the button, an entire paragraph can change text case or font formatting to UPPERCASE or lowercase online. No need of opening Microsoft Word to change text case. What are some of the Word Count limit for School and College essays? College admission essays have a word count limit ranging from 200–650 words Undergraduate college essay essays have a word count limit ranging from 200–650 words Graduate school admission essays have a word count limit ranging from 1500–5000 words Graduate school essays have a word count limit ranging from 2500–6000 words words words. How to calculate Words per minute (WPM) using Word Counter Tool? You can count the number of characters and words you type in minutes and seconds to find your typing speed and WPM count. To find the Words per Minute (WPM) count, press the Start button and type for a minute. You will see how many words you typed for a minute. This is your WPM. © 2022 WordCounterTool.com Type away to join 150+ million test takers! select Your test You voted - and we switched to the dark style Take The Next Step What if you could type as fluently as you speak? Typing Trainer web course will get you there! Now the joy starts! Play our numerous fun typing games to become a true keyboard master. Well, What's New! A certificate has been one of the most requested features, and we're happy to announce that a test with a printable certificate is now available! The certification test consists of 5 minutes of typing predefined source text in English. Read more.. Compete against other talented typists around the globe and show where the best typists come from. Each country has its own league and you can advance higher in the rankings by completing races and collecting points. Start the Race! More Articles The average typing speed is around 40 words per minute (wpm). If you want to be very productive, you should aim for a typing speed of 65 to 70 words per minute. It’s easy with the right technique! To type faster, you need to learn how to position yourself correctly, use all your fingers, hit the right keys without looking and avoid making mistakes. If you haven’t mastered any one of these things, you will benefit from a typing training program. Typing Pal’s training program covers every aspect of proper typing technique, offering a complete and customized program with hundreds of activities that are suitable for beginners and veterans alike. Our method has helped millions of users achieve their goals. You will see improvement in a few weeks if you practice often, concentrate on accuracy over speed and adopt the proper technique. The hardest part is forgetting your bad habits, even if it means typing more slowly at first.
